

FORTRAN Program 1

Grade Averaging Program

- Include the program name, program number, names of those that wrote the program, and if it is a group effort the group number at the top of the program.
- Name the program LastNameP1.F or GxP1.F where x is the group number.
- Write a Structured FORTRAN program that will prompt the user for a name, and the number of grades to be entered. The program will read the name and the integer and then prompt and read the n grades from the user. Grades are real numbers.
- The program will calculate the sum of the grades as they are read into the program.
- When all of the grades are entered, the program will calculate the average of the grades.
- The program will print the name, total of the grades and the average of the grades on the screen.
- The output will be properly formatted for the application.
- Do not use any GOTO's.
- Comment your program.
- Turn the program in, as an ASCII file. Include your name, possible group number, class, and program name when submitting the program.
